Park
Design

Boston's park system was designed by Frederick Law Olmsted between 1878 and 1896. Later coined the Emerald Necklace, this 7-mile-long chain of parks, parkways and waterways includes the Back Bay Fens (and Charlesgate Park), the Riverway, Olmsted Park, Jamaica Pond, Arnold Arboretum and Franklin Park. The system spans over 1,000 acres and accounts for half of the City of Boston's park acreage.

Emerald Necklace

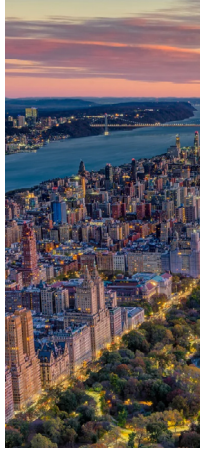

The Emerald Necklace is one of the nation's earliest examples of green infrastructure, using natural materials like stone, earth, and plants to absorb water and filter pollutants. This innovative system of interconnected waterways and parkland not only improved sanitation in a rapidly expanding Boston but also transformed a oncepolluted area into a series of linked parks for residents to enjoy.

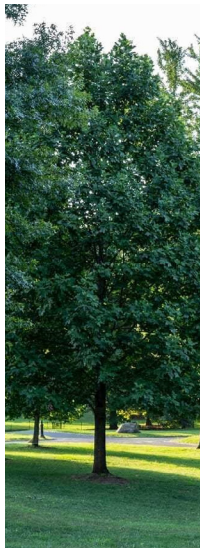

Each unique “jewel” of the Emerald Necklace—waterways, botanical gardens, meadows, and tree museums—brings Boston's citizens closer to nature. Its tranquil waters, shaded shores, and forested banks create stunning reflections and flickering light, enhancing the park's natural beauty.

Central Park

Central Park serves as a vital ecological and environmental asset for the city. With over 18,000 trees, it helps purify the air and regulate temperatures. Spanning 843 acres, the park features expansive lawns, woodlands, winding streams, and wide-open lakes. It offers a diverse habitat for wildlife while blending formal and informal landscapes to create inviting spaces for community gatherings.

Olmsted's park design strikes a delicate balance between serene pastoral meadows, offering a sense of peaceful spaciousness for quiet reflection, and enchanting picturesque woodlands, with meandering streams and expansive lakes that stir the imagination.
